Jenkins使用说明

我们将Jenkins服务器部署在腾讯云服务器 159.75.116.78:8080 上,建立了一个IRBL多分支流水线。其中包括master分支和dev分支,使用gitlab的push信息触发构建,用Jenkinsfile进行CI/CD的构建设置。如下是我们的Jenkinsfile文件。

```
pipeline {
1
 2
        agent any
 3
        triggers {
           GenericTrigger(
 4
               causeString: 'Triggered by develop',
 6
               genericVariables: [[key: 'ref', value: '$.ref']],
               printContributedVariables: true,
               printPostContent: true,
8
               regexpFilterExpression: 'refs/heads/' + BRANCH_NAME,
9
10
               regexpFilterText: '$ref',
               token: 'siegelion'
11
12
           )
13
        }
        stages {
14
           stage('build') {
15
16
              steps {
                  echo 'Notify GitLab'
18
                  sh "/usr/lib/maven/apache-maven-3.6.3/bin/mvn install"
                  updateGitlabCommitStatus name: 'build', state: 'pending'
19
                  updateGitlabCommitStatus name: 'test', state: 'success'
20
21
              }
           }
           stage('test') {
23
24
               steps {
25
                    updateGitlabCommitStatus name: 'test', state: 'pending'
26
                    echo 'start python test'
27
                    sh "/lib/miniconda/envs/py37/bin/python
    src/main/python/irbl/test.py"
28
                    echo 'start java test'
29
                    sh "/usr/lib/maven/apache-maven-3.6.3/bin/mvn
    org.jacoco:jacoco-maven-plugin:prepare-agent -f pom.xml clean test -
    Dautoconfig.skip=true -Dmaven.test.skip=false -
    Dmaven.test.failure.ignore=true"
30
                    jacoco changeBuildStatus: true, maximumLineCoverage: '10'
31
               }
           }
32
33
           stage('master deploy test'){
34
              when{
                  branch 'master'
35
36
              }
37
              steps{
38
                 echo 'springboot'
39
                 sh "/usr/lib/maven/apache-maven-3.6.3/bin/mvn spring-boot:run"
                  // sh "mvn spring-boot:run"
40
41
                  updateGitlabCommitStatus name: 'test', state: 'success'
              }
42
43
           }
```

```
44
           stage('dev deploy test'){
45
              when{
                 branch 'dev'
46
47
              }
48
              steps{
                 echo 'springboot'
49
50
                 sh "/usr/lib/maven/apache-maven-3.6.3/bin/mvn spring-boot:run"
                 // sh "mvn spring-boot:run"
51
52
                 updateGitlabCommitStatus name: 'test', state: 'success'
53
              }
54
           }
55
        }
56
     }
57
```

其中,我们将Jenkins的构建分为了几个阶段,分别为build,test,master deploy和dev deploy,其中master deploy和dev deploy暂时没有任何区别,在后续的后台开发中会涉及到对应内容。

其中build阶段和deploy阶段都清晰易懂,在test阶段,由于项目包含了JAVA和Python两大模块,我们分别建立了python的test.py和java的springboot test,使用jacoco进行测试覆盖的检查。
